

DClaw SEO ? User Guide

Rank higher with AI. DClaw SEO is an AI-native SEO platform: audit sites, research keywords, generate and optimize content, track and forecast rankings, manage local SEO, and ship white-label reports ? with an AI Copilot on every page. Every AI feature runs on a configurable LLM (local Ollama by default) and never fabricates data: when a provider or key is missing, the feature falls back to real free-data sources or clearly-labeled deterministic output.

1. Getting started

1. Sign up. Open the app, choose Create account, and register with an email, password, and organization name. You're issued a session token and land on the Dashboard.
2. Configure your LLM (optional). Go to Settings to point the app at a local Ollama instance or an OpenRouter key. Without one, AI features still return useful, clearly-labeled results from real free data.
3. Add a project under Account to organize work by site.

All feature APIs require sign-in; your data and LLM spend are isolated per organization.

2. Core SEO tools

Page | What it does

Dashboard | Visibility/activity summary backed by real counts.

Audit | Deep technical crawl ? 50+ issue types with AI-prioritized fixes.

Keywords | Long-tail expansion (Google Suggest) + AI intent/clustering.

Content | Score content 0?100 on readability, density, coverage.

Rankings | Record positions, detect >5-place drops, view trends.

Backlinks | Toxicity scoring, new/lost detection.

Competitor | Keyword/content gap analysis vs a competitor.

Content Brief | SERP-aware outline, questions, length, secondary keywords.

Performance | Core Web Vitals (LCP/INP/CLS) via PageSpeed Insights.

3. AI content suite

- AI Writer (/writer) ? long-form article drafts with an originality check and LLM fact-check notes.
- Meta & Schema (/meta) ? optimized title/meta tags, Open Graph + Twitter cards, and JSON-LD schema for any URL or pasted content.
- Video SEO (/video) ? three CTR-tuned YouTube title variants, a description, tags, and hashtags.

4. Local SEO (/local)

Register a business with its canonical NAP (Name/Address/Phone), then:

- Add directory citations (Yelp, YellowPages, ?).
- Run a NAP consistency scan ? normalized comparison flags exact mismatched fields and scores consistency.
- Log reviews and get an AI-drafted response for each.
- With GBPAPIKEY set, sync directly from Google Business Profile.

5. Forecasting & reports

- Forecast (/forecast) ? projects future rank positions from your real rank history (least-squares trend, competitor-adjusted). Needs ?2 recorded checks; otherwise it says so rather than guessing.
- Reports (/reports) ? branded PDF/CSV from your real metrics with an AI executive summary. Schedule recurring delivery (email activates when SMTP is configured; reports always generate).

6. Account, billing & cost control

- Account (/account) ? org details, projects, and the LLM cost ledger: every AI call is metered (tokens + cost). Set a monthly cost cap; once hit, AI calls return a clear "cap reached" message.
- Billing (/billing) ? choose Free / Starter / Pro; preview an invoice computed from your plan, seats, and metered usage. Connect Stripe with STRIPEAPIKEY (local invoicing works without it).

7. The AI Copilot

The floating Copilot is available on every page. Give it a URL and it fetches the page, evaluates on-page signals against SEO best practices, and returns prioritized next actions ? not just answers.

8. Operations

- Health: GET /health (liveness), GET /admin/health (readiness: DB + LLM).
- Metrics: GET /metrics (Prometheus). A Grafana dashboard is provided in observability/.
- Deploy: production Helm chart in helm/dclaw-seo (CloudNativePG, TLS ingress, non-root pods). See helm/README.md.
- Security: see SECURITY.md (JWT auth, bcrypt, non-root containers, no hardcoded secrets, dependency audit).
